

Evaluation of glyphosate programs in corn. Horky, Kevin T. and Alex R. Martin. A field study was conducted to evaluate the efficacy of weed control programs using glyphosate in corn. A randomized complete block design with three replications per treatment was utilized. The study was conducted on a Sharpsburg silt loam with 2.7% organic matter and a pH of 6.8. Individual plots consisted of six 30-inch rows, each 30 feet long. 'Dekalb 6019RR' corn was planted May 5 at a population of 20,600 seeds per acre. Treatments were applied with a tractor-mounted sprayer traveling 3.0 mph. MPOST treatments were applied 29 days after planting, and LPOST treatments were applied 35 days after planting. Application, crop, weed, and environmental data are presented below:

| Date | May 6 PRE | June 3 MPOST | June 9 LPOST |
|-------------------------------|--------------|-----------------|-----------------|
| Treatment Sprayer | | | |
| gpa | 15 | 15 | 15 |
| psi | 30 | 30 | 30 |
| Temperature (°C) | | | |
| air | 29 | 29 | 22 |

| Palmer amaranth | | | |
| height (cm) | -- | 10 | 20 |
| infestation (m ²) | -- | 6 | 6 |

Summary comments: The post treatments generally improved control of common sunflower and velvetleaf. Post treatments containing rimsulfuron caused some crop injury. Results of the study are summarized in the following table. (Dept. of Agronomy and Horticulture, University of Nebraska-Lincoln)
