

Weed Control in Corn

Sequential herbicide systems for weed control in corn. Urbana, Illinois, 2005. Maxwell, Douglas J., Aaron G. Hager, and James L. Moody. The objective of this research was to evaluate sequential herbicide systems for weed control in corn. The study was established at the Crop Sciences Research and Education Center, Urbana, IL. The soil was a Flanagan silt loam with a pH of 6.4 and 4.8% organic matter. Pioneer 3367 corn was planted 2 inches deep on April 28 in 30 inch rows. Treatments were arranged in randomized complete blocks with three replications of plots 7.5 by 36 feet. Herbicides were applied with a CO₂ backpack sprayer delivering 20 gpa and equipped with 80025 air induction nozzles. Application information is listed below:

| Date | April 28 | May 25 | June 1 |
|---------------------------|----------|--------|--------|
| Application | pre | epost | post |
| Temperature (F) | | | |
| Air | 52 | 72 | 80 |
| Soil | 52 | 69 | 75 |
| Soil Moisture | moist | moist | dry |
| Wind (mph) | 7-SW | 6-N | 4-E |
| Sky Cover (%) | 100 | 0 | 0 |
| Precip. after application | | | |
| Week 1 (inch) | 0.05 | 0.00 | 0.03 |
| Week 2 (inch) | 0.07 | 0.03 | 1.67 |
| Relative humidity (%) | 40 | 33 | 30 |
| Corn | | | |
| Leaf no. | - | 2 | 5 |
| Height (inch) | - | 5 | 12 |
| Giant Foxtail | | | |
| Leaf no. | - | 2 | 3 |
| Height (inch) | - | 2 | 5 |
| Common Lambsquarters | | | |
| Leaf no. | - | 7 | >9 |
| Height (inch) | - | 1.5 | 3.5 |

| Leaf no. | - | 2 | 4 |
| Height (inch) | - | 2 | 3 |
| Velvetleaf | | | |
| Leaf no. | - | 1 | 4 |
| Height (inch) | - | 1 | 3 |
| Tall Morningglory | | | |
| Leaf no. | - | 1 | 5 |
| Height (inch) | - | 1 | 2 |

There was no crop injury observed with any of the treatments. Control of giant foxtail at the time of postemergence application was < 70% for all preemergence treatments, except acetochlor&atrazine (as Keystone) and S-metolachlor&atrazine (as Bicep II Magnum) treatments. Broadleaf weed control from preemergence treatments was fair to poor under the dry conditions and heavy weed pressure. Early postemergence treatments greatly improved broadleaf weed control (87-99%) but managed only 65-77% giant foxtail control 15 days after application (DAA). Broadleaf control remained excellent (87-99%) for early postemergence treatments 37 DAA. Giant foxtail control declined for early postemergence treatments by 37 DAA. Postemergence treatments showed a similar improvement in broadleaf weed control at 8 and 30 DAA. Giant foxtail control from postemergence applications did not greatly improve at 8 and 30 DAA, with the exception of treatments containing 0.016 lb/a topramezone (as Impact). Topramezone treatments maintained giant foxtail control at 83-88% 30 DAA. The highest yields were obtained from the 3 postemergence topramezone treatments and the early postemergence nicosulfuron&rimsulfuron-containing treatment. (Dept. of Crop Sciences, University of Illinois, Urbana).
